

Cornell Notes 	Topic/Objective: <u>Pythagorean's Converse</u>	Name: Dr. Fuller's 8 th grade Math Class Date:
Essential Question: <u>How can I use the Pythagorean Theorem's Converse to prove that a triangle is a right triangle?</u>		
Questions/Parent Review What is the Pythagorean theorem? What is the converse of the Pythagorean Theorem?	<p>The Pythagorean Theorem says that</p> <p>→ $a^2 + b^2 = c^2$ is true relationship</p> <p>for all right triangles. This theorem works for every "right triangle"</p>  <p style="margin-left: 200px;"> $a = 3$ $b = 4$ $c = 5$ </p> <p style="margin-left: 200px;"> <small>NOTE: A right triangle has one right angle - 90° indicated by a small square</small> </p> <p style="margin-left: 100px;"> $3^2 + 4^2 = 5^2$ $9 + 16 = 25$ $25 = 25$ </p> <p>Converse: If the Pythagorean Theorem works for all right triangles then the converse says that all right triangles will work or give a true statement when plugged into the Pythagorean Theorem.</p>
